For beginners and those at an entry level, see Photo Retouching and Photo Restoration instead of Photoshop. Content Photoshop has much more to offer than just simple image editing. From direct photo manipulation to effects, text, and layers, Photoshop is the industry standard for image manipulation. It is used widely by professionals in a wide variety of fields. When you

edit an image or make a graphic, Photoshop is your best bet for creating compelling graphics quickly. Every channel in the image, including color, grayscale, and black and white, can be altered. You can change the channels to manipulate the light. In the same way, you can use multiple layers to create masking effects. You can work on one layer and create another in the background, or you can create a new layer and work on it

without seeing the changes on the original layer. You can also work with selections, including live text, that you can zoom to change the size. The selections and masks enable you to create complex graphics quickly. To see just how much information you can get out of a photo, open Figure 6-1 in Photoshop (Windows). A series of options are presented on the left side of the screen, and the standard keyboard is used to alter the image. **Figure

6-1:** Try this photo as a template for your own image manipulation. Fitting a photo into an envelope The idea of Photoshop is to keep images neat. It enables you to fit a photo into a frame, print it on a postage-sized envelope, or use it as a small postcard. Unlike traditional non-photo editing programs such as Paint, Photoshop can handle photographs in most any aspect ratio. You can easily change the size of the photo in the photo editor and then

export the photo. (See the section "Exporting an image," later in this chapter, for details.) To fit a photograph onto an envelope or similar flat surface, try the following steps: 1. Open a new image in Photoshop that is large enough to hold the photograph and display the dotted line (marked with an arrow) in the image. 2. Select the outline by clicking the dotted line to select the layer. 3. Layers can be moved around using the Move tool,

which is on the top tool bar. Click the Move tool (like a pencil) and drag the outline to the desired location. 4. When the dotted line

Q: How can I execute different commands in order on separate windows? I have a VSCode window (Window: "Debug") with a debugger attached, and a second window (Window: "Release") with a project build. I am trying to achieve the following behavior: First run the "Release" window, select a particular function for debugging (e.g. local file), hit a shortcut key to run the

debugger and keep running until the function in question is reached, then close the debug window. Then run the "Release" window again, this time do the same with a different function (etc.). This can be modeled as "sequence" or "producer/consumer", or some combination of the two. That is, I would like to be able to run the "Release" window multiple times, and then have my debug window run in sequence with it. Steps to

reproduce: 1. Open the "Release" window 2. Run the "Debugger" in VSCode, to a file 3. Open the "Release" window again 4. Run the "Debugger" again, this time to a different file

The problem: The debugger in the second window always starts at the beginning of the function, not from the location of where the debugger in the first window left off. I've tried the following with no success: Committing the folder of the workspace that contains the debug and

release windows, with no luck. They persist in the workspace and reopen the same files. Putting the files in a different folder, and setting the Windows "Startup folder" to that folder, also with no luck. I have these scripts in place to open the files in the right windows and keep them open, but when the second window runs, the debugger already exists.

```
var debugWindow = atom.workspace.open(require('path').join(__dirname, 'debug.json')) var
```

```
releaseWindow = atom.works
pace.open(require('path').join(
  __dirname, 'release.json'))
function step() { releaseWindo
w.revealActiveTextEditor() rel
easeWindow.revealTextEditor
Contents(function() { debugWi
ndow.revealTextEditorContent
s(function() { // Step as
normal var values =
steps.get('running
```
